| Comments: | This mix design will exceed the required laboratory strength when slumps 5.0" or less. | | |
| Footnotes: | *SSD Weights and Spec Gravities. **Admixture dosage rates will be adjusted according to manufacturers recommendations to accommodate varying field conditions. | | |

This mix design is predicated on the specific information and/or materials provided by the customer and therefore, Ash Grove makes no representation or warranties concerning their application to general field use where other variables may occur. Change in design components or proportions, material gradations and/or field placement and curing practices will all strongly affect the ultimate quality of the concrete. User should confirm each laboratory design with concrete batched on site and then routinely run quality control checks to verify yield, air content and compressive strength because the physical and chemical characteristics of materials may vary.

Now offering LDCC Low density Cellular Concrete for pipe abandonment, sewer abandonment and excellent for backfill thanks to a low lateral pressure and weight. LDCC is available in 27 lbs. per cubic foot & up to 100 lbs. per cubic foot. Permeable and non-permeable LDCC depending on application.

^A Default table maximum may be exceeded if Test Method ASTM C1038/C1038M limit is met.

^B Not applicable.

^C Test results for this production period may not be available and most recent test results provided (some data may be for information only).

^D Required only if percent SO₃ exceeds the limit in Table 1.

^E As per ASTM C1778, Portland Cement is defined as "Clinker + Gypsum" constituents and is to be used for calculating equivalent alkalis in the base cement.

We certify that the above described blended cement, at the time of shipment, meets the chemical and physical requirements of the ASTM C595/C595M Type IL(HS) and AASHTO M240 Blended Hydraulic Cement specifications.
